

选择题: CBBBD

填空题: 6. $\ln(\ln 5)$

7. $8,$

8. $64,$

9. $\frac{1}{6}dx$

10. 1

11. 求极限 $\lim_{x \rightarrow 0} \left(\frac{1}{x \tan x} - \frac{1}{x^2} \right)$.

解:

$$\begin{aligned} \lim_{x \rightarrow 0} \left(\frac{1}{x \tan x} - \frac{1}{x^2} \right) &= \lim_{x \rightarrow 0} \frac{x - \tan x}{x^2 \tan x} = \lim_{x \rightarrow 0} \frac{x - \tan x}{x^3} \dots\dots 3' \\ &= \lim_{x \rightarrow 0} \frac{1 - \sec^2 x}{3x^2} = \lim_{x \rightarrow 0} \frac{-\tan^2 x}{3x^2} = -\frac{1}{3} \dots\dots 4' \end{aligned}$$

12. 求不定积分 $\int \arctan \sqrt{x} dx$.

解: 令 $\sqrt{x} = t$, 则 $x = t^2$, $dx = 2t dt$

于是

$$\begin{aligned} \int \arctan \sqrt{x} dx &= 2 \int t \arctan t dt \dots\dots 2' \text{ (换元)} \\ &= \int \arctan t d(t^2) = t^2 \arctan t - \int t^2 d(\arctan t) \\ &= t^2 \arctan t - \int \frac{t^2}{1+t^2} dt \dots\dots 3' \text{ (分部积分)} \\ &= t^2 \arctan t - \int \frac{t^2 + 1 - 1}{1+t^2} dt \\ &= t^2 \arctan t - \int dt + \int \frac{1}{1+t^2} dt = t^2 \arctan t - t + \arctan t + c \\ &= (1+t^2) \arctan t - t + c = (1+x) \arctan \sqrt{x} - \sqrt{x} + c \dots\dots 2' \end{aligned}$$

13. 求定积分 $\int_0^{\ln 2} \sqrt{e^x - 1} dx$.

$$\int_0^{\ln 2} \sqrt{e^x - 1} dx \stackrel{\sqrt{e^x - 1} = t}{=} \int_0^1 t d \ln(1+t^2) = \int_0^1 t \frac{2t}{1+t^2} dt = 2 \int_0^1 \frac{t^2}{1+t^2} dt \dots\dots 4'$$

$$\begin{aligned} \text{解: } &= 2 \int_0^1 \frac{t^2 + 1 - 1}{1+t^2} dt = 2 \left[\int_0^1 1 dt - \int_0^1 \frac{1}{1+t^2} dt \right] \\ &= 2(1 - \arctan x \Big|_0^1) = 2 - \frac{\pi}{2} \dots\dots 3' \end{aligned}$$

14. 设 $f(x) = e^{-x} + \int_0^x (x-t)f(t)dt$, 其中 $f(x)$ 二阶可导, 求 $f(x)$.

解: $f(x) = e^{-x} + \int_0^x (x-t)f(t)dt = e^{-x} + x \int_0^x f(t)dt - \int_0^x tf(t)dt$

$$f'(x) = -e^{-x} + \int_0^x f(t)dt + xf'(x) - xf'(x) = -e^{-x} + \int_0^x f(t)dt$$

$$f''(x) = e^{-x} + f(x) \Leftrightarrow f''(x) - f(x) = e^{-x}. \quad \dots\dots\dots 3'(\text{得出微分方程})$$

解此方程得通解: $f(x) = ae^{-x} + be^x - \frac{1}{2}xe^{-x}$.

由条件可得 $f(0) = 1$, $f'(0) = -1$, 于是

$$f(x) = \frac{3}{4}e^{-x} + \frac{1}{4}e^x - \frac{1}{2}xe^{-x}. \quad \dots\dots\dots 4'(\text{求解微分方程})$$

证明题 6'*2=12'

15. 设 $f(x)$ 一阶可导, 且 $f''(x_0)$ 存在. 求证:

$$\lim_{h \rightarrow 0} \frac{f(x_0 + 2h) - 2f(x_0 + h) + f(x_0)}{h^2} = f''(x_0)$$

证法一:

$$\begin{aligned} & \lim_{h \rightarrow 0} \frac{f(x_0 + 2h) - 2f(x_0 + h) + f(x_0)}{h^2} \\ &= \lim_{h \rightarrow 0} \frac{2f'(x_0 + 2h) - 2f'(x_0 + h)}{2h} \\ &= \lim_{h \rightarrow 0} \frac{f'(x_0 + 2h) - f'(x_0 + h)}{h} \quad \dots\dots\dots 3 \text{分} \quad (\text{洛必达法则}) \\ &= \lim_{h \rightarrow 0} \frac{(f'(x_0 + 2h) - f'(x_0)) - (f'(x_0 + h) - f'(x_0))}{h} \\ &= \lim_{h \rightarrow 0} \frac{f'(x_0 + 2h) - f'(x_0)}{h} - \lim_{h \rightarrow 0} \frac{f'(x_0 + h) - f'(x_0)}{h} \\ &= 2f''(x_0) - f''(x_0) = f''(x_0) \quad \dots\dots\dots 3 \text{分} \quad (\text{二阶导数定义}) \end{aligned}$$

证法二: 由 Peano 定理

$$\begin{aligned} f(x_0 + 2h) &= f(x_0) + f'(x_0) \cdot 2h + \frac{1}{2}f''(x_0) \cdot (2h)^2 + o(h^2) \\ &= f(x_0) + 2f'(x_0) \cdot h + 2f''(x_0) \cdot h^2 + o(h^2) \end{aligned}$$

$$f(x_0 + h) = f(x_0) + f'(x_0) \cdot h + \frac{1}{2}f''(x_0) \cdot h^2 + o(h^2)$$

$$\dots\dots\dots 3 \text{分} \quad (\text{Taylor 定理的使用})$$

于是

$$\begin{aligned} & f(x_0+2h)-2f(x_0+h)+f(x_0) \\ &= f(x_0)+2f'(x_0)\cdot h+2f''(x_0)\cdot h^2+o(h^2)-2\left[f(x_0)+f'(x_0)\cdot h+\frac{1}{2}f''(x_0)\cdot h^2+o(h^2)\right]+f(x_0) \\ &= f''(x_0)\cdot h^2+o(h^2) \end{aligned}$$

所以

$$\lim_{h\rightarrow 0}\frac{f(x_0+2h)-2f(x_0+h)+f(x_0)}{h^2}=\lim_{h\rightarrow 0}\frac{f''(x_0)\cdot h^2+o(h^2)}{h^2}=f''(x_0)$$

16. 函数 $f(x)$ 在闭区间 $[0,2020]$ 上连续, 在开区间 $(0,2020)$ 内可导, 且

$f(0)+f(1)+\cdots+f(2019)=2020$, $f(2020)=1$, 试证必存在 $\xi\in(0,2020)$ 使得

$f'(\xi)=0$ 。

证明: $\because f(x)$ 在闭区间 $[0,2020]$ 上连续,

$\therefore f(x)$ 在闭区间 $[0,2019]$ 上连续, 从而在 $[0,2019]$ 上必有最大值和最小值,

分别设为 M 和 m , 于是

$$m\leq f(0)\leq M, \quad m\leq f(1)\leq M, \quad \cdots, \quad m\leq f(2019)\leq M,$$

故

$$m\leq \frac{f(0)+f(1)+\cdots+f(2019)}{2020}\leq M$$

由连续函数的介值定理知, 至少存在一点 $x_0\in[0,2019]$ 使得

$$f(x_0)=\frac{f(0)+f(1)+\cdots+f(2019)}{2020}$$

由 $f(0)+f(1)+\cdots+f(2019)=2020$ 得 $\frac{f(0)+f(1)+\cdots+f(2019)}{2020}=1$, 于是

$$f(x_0)=1.$$

.....3 分 (介值定理)

$\because f(x)$ 在闭区间 $[x_0,2020]$ 上连续, 在 $(x_0,2020)$ 内可导, 且

$f(x_0)=f(2020)=1$, 由 Rolle 定理知, 必存在 $\xi\in(x_0,2020)\subseteq(0,2020)$ 使得

$$f'(\xi) = 0.$$

.....3 分（罗尔定理）

解答题 10'*2=20

17. 设函数 $y(x)$ 是微分方程 $y' - xy = \frac{1}{2\sqrt{x}}e^{\frac{x^2}{2}}$ 满足 $y(1) = \sqrt{e}$ 的特解,

(1) 求 $y(x)$;

(2) 设平面区域 $D = \{(x, y) | 1 \leq x \leq 2, 0 \leq y \leq y(x)\}$, 求 D 绕 x 轴旋转所得的旋转体的体积。

解: (1) $y = e^{-\int x dx} \left[\int \frac{1}{2\sqrt{x}} e^{\frac{x^2}{2}} e^{-\int x dx} dx + C \right] = e^{-\frac{x^2}{2}} (\sqrt{x} + C)$

代入初值可得 $C=0$, 于是 $y = \sqrt{x}e^{-\frac{x^2}{2}}$.

.....5 分

(2) $V_x = \pi \int_1^2 \left(\sqrt{x}e^{-\frac{x^2}{2}} \right)^2 dx = \pi \int_1^2 x e^{-x^2} dx = \frac{\pi}{2} (e^{-1} - e^{-4})$

18. 作函数 $y = \frac{1}{1+x^2}$ 的简图, (写出解答过程, 图中需标注: 单调性/凹凸性, 极值点和拐点以及渐近线等信息)

解:

$$f'(x) = \frac{-2x}{(1+x^2)^2} \begin{cases} > 0, & x < 0, & f \uparrow; \\ = 0, & x = 0, & f(0) = 1 \text{ 达到最大值;} \\ < 0, & x > 0, & f \downarrow. \end{cases}$$

.....3 分

$$f''(x) = \frac{2(3x^2 - 1)}{(1 + x^2)^2} \begin{cases} > 0, & x < -\frac{1}{\sqrt{3}}, & \text{凹弧,} \\ = 0, & x = -\frac{1}{\sqrt{3}}, & \text{拐点,} \\ < 0, & -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}}, & \text{凸弧,} \\ = 0, & x = \frac{1}{\sqrt{3}}, & \text{拐点,} \\ > 0, & x > \frac{1}{\sqrt{3}}, & \text{凹弧,} \end{cases}$$

$$f(0) = 1, \quad f\left(\pm \frac{1}{\sqrt{3}}\right) = \frac{3}{4}.$$

又 $\lim_{x \rightarrow \infty} \frac{1}{1 + x^2} = 0$, 所以 $y = 0$ 为渐近线。
